

10 Gigabit networks must use multimode fiber

Article Overview

10 Gigabit Ethernet networks do not have to use multimode fiber; both multimode and single-mode fiber can be used depending on distance and application.

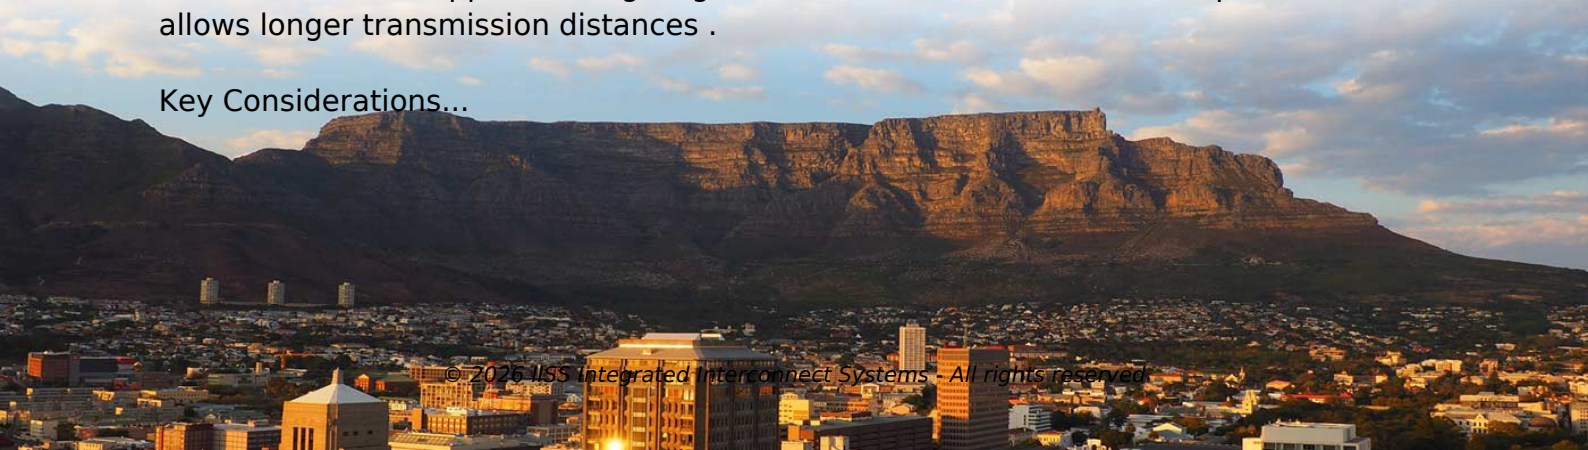

Multimode Fiber for 10GbE

Multimode fiber (MMF) is commonly used for short-distance 10GbE links, particularly in data centers and enterprise networks. The 10GBASE-SR standard uses 850 nm VCSEL lasers and is optimized for multimode fiber, typically OM3 or OM4, supporting distances up to 300–400 meters depending on fiber quality and network design . Older multimode types like OM1 and OM2 have much shorter reach, with OM1 supporting only about 33 meters for 10GBASE-SR . Multimode fiber is cost-effective, consumes less power, and is ideal for high-density switch-to-server connections .

Single-Mode Fiber for 10GbE

Single-mode fiber (SMF) can also be used for 10GbE, especially for long-distance links. Standards like 10GBASE-LR operate at 1310 nm and can reach distances up to 10 km over single-mode fiber. Unlike multimode fiber, single-mode fiber uses a smaller core and supports a single light mode, which reduces modal dispersion and allows longer transmission distances .
