

Applications of Optical Communication

EML Products

Overview

EML diodes combine a laser and an electro-absorption modulator on one chip to enable fast and stable optical data transmission over long distances. They provide high-speed modulation with low signal distortion, making them ideal for demanding networks like metro and backbone systems. For example, 28 Gbaud PAM4 signals can reach up to 240 km on standard SMF. Picking the wrong one means you're either overpaying or underperforming, so it's worth understanding what each type actually does well. This article compares three laser technologies used. As streaming music and video becomes a common service, there is growing interest in Fiber-to-the-Home (FTTH), an optical communication system that provides high-speed, stable bandwidths to each household. The adoption of faster communication technologies such as 10G-EPON and XG-PON is progressing.
