

Attenuation Principle of Fiber Optic Splitter

Overview

A fiber-optic splitter, also known as a , is based on a of an integrated waveguide power distribution device, similar to a The system uses an optical signal coupled to the branch distribution. The splitter is one of the most important in the link. It is an optical fiber tandem device with many input and output terminals, especially applicable to a passive optical network (,,.

Article Overview

Fiber optic splitters attenuate optical signals by dividing the input light among multiple outputs, with the amount of attenuation determined by the split ratio and splitter type.

Working Principle

A fiber optic splitter is a passive optical device that divides a single input light signal into multiple output signals. The attenuation occurs naturally because the optical power is distributed among the output fibers, meaning each output receives only a fraction of the original signal power (). This is often referred to as insertion loss, which is the reduction in signal power caused by the splitting process ().

Split Ratios and Attenuation

The split ratio defines how the input power is divided. For example, a 1x2 splitter divides the input signal into two outputs, each receiving roughly half the power, whi...

A fiber-optic splitter, also known as a beam splitter, is based on a quartz substrate of an integrated waveguide optical power distribution device, similar to a coaxial cable transmission system. The optical network system uses an optical signal coupled to the branch distribution. The fiber optic splitter is one of the most important passive devices in the optical fiber link. It is an optical fiber tandem device with many input and output terminals, especially applicable to a passive optical network (EPON, GPON, BPON, FTTX
