

Bow-shaped polarization-maintaining optical fiber

Overview

This polarization-maintaining fiber is optimized for fiber optic gyroscope (FOG) applications. It is designed for optimal performance over a wide temperature range and with a small coil radius. A polarization maintaining optical fiber is made through adopting a modified chemical vapor. □□ For purchasing, use the RP Photonics Buyer's Guide for polarization-maintaining fibers. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions. Stress rods run parallel to the fiber's core and apply stress that creates birefringence in the fiber's core, allowing polarization-maintaining. In fiber optics, polarization-maintaining optical fiber (PMF or PM fiber) is a single-mode optical fiber in which linearly polarized light, if properly launched into the fiber, maintains a linear polarization during propagation, exiting the fiber in a specific linear polarization state; there is. Thorlabs' polarization-maintaining optical fibers are available with operating wavelengths from 350 nm to 2. Our selection includes PANDA, bow-tie, Zing™, and specialty spun fibers.
