

Cable tray bends have those kinds of

Article Overview

Cable tray bends include horizontal bends, vertical bends, tees, crosses, and reducers, each designed to guide cables safely and efficiently through complex layouts.

Horizontal Bends

A horizontal bend changes the direction of the cable tray along the same plane, typically at angles of 30°, 45°, or 90°. These bends are commonly used to navigate around walls, columns, or other obstacles while keeping the tray at the same elevation. They help minimize cable stress and reduce the need for additional connectors.

Vertical Bends (Risers)

Vertical bends, also called risers, allow the cable tray to move between different elevations. They are essential when routing cables from one floor to another or when avoiding machinery and structural elements. Vertical bends can be upward or downward, depending on the installation requirements.

Tees and Crosses

Tees and crosses are used to create branches in the cable tray system. A tee allows a single main run to split into two directions, while a cross enables four-way branching. These fittings are crucial for distributing cables to multiple areas efficiently....
