

Can a router be connected under a fiber optic cable

Article Overview

To connect a router under a fiber optic setup, the fiber line must first pass through an Optical Network Terminal (ONT) before linking to your router via Ethernet.

Required Components

- Optical Network Terminal (ONT): Converts the incoming optical signal into an electrical signal your router can use, usually provided by your ISP .
- Fiber Optic Cable: Typically single-mode with SC/APC or SC/UPC connectors, connecting the ISP's fiber entry point to the ONT .
- Fiber-Ready Router: Ensure your router supports gigabit speeds or has a WAN/SFP port compatible with fiber input .
- Ethernet Cable: Cat6a or higher is recommended to maintain high-speed performance between the ONT and router .
- Power Cables: For both the ONT and router.

Step-by-Step Connection

- Position the ONT: Place it near the fiber entry point, ideally within 3 meters, to minimize signal loss .
- Connect Fiber to ONT: Remove protective caps and carefully insert the fiber cable into the ONT's optical port, ensuring a secure fit to avoid signal degradation .
- Link ONT to Router: Use an Ethernet cable to connect the ONT's LAN/Ethernet port to the router's WAN port. For advanced setups, an SFP+ module may be used for multi-gigabit speeds
