

Circuit Distribution Box Specifications

Article Overview

A distribution box typically includes a main switch, circuit breakers, and protective devices rated according to the total load, with single-phase boxes usually operating at 230V AC and three-phase boxes at 400V AC.

Key Components and Ratings

Main Switch / Main MCB: The main switch controls the entire electrical supply to the distribution box. In domestic single-phase installations, it is usually a double-pole MCB rated around 63A, while commercial or industrial three-phase boxes may have higher-rated main switches depending on total load ().

Circuit Breakers: Individual circuits are protected by single-pole or double-pole MCBs. Single-pole MCBs are used for standard lighting and outlet circuits, while double-pole MCBs may be used for high-power appliances or special loads. The rating of each MCB depends on the connected load, typically ranging from 6A to 32A for domestic circuits ().

Residual Current Circuit Breakers (RCCBs): RCCBs are essential for safety, protecting against earth leakage and preventing electric shocks. They are rated based on the maximum current of the circuit and the sensitivity, commonly 30mA for domestic use ().

Bus Bars and Wiring: Distribution boxes include bus bars for phase, neutral, and earth connections. The bus bars must be rated to handle the maximum current of the box. Wiring inside the box should comply with electrical codes and be sized according to the load ().

System Configuration

Single-Phase Distribution Box: Typically used in homes and small offices, operating...
