

Comparison of high temperature resistance and reliability of mini PLC splitters

Overview

FBT Splitters: More sensitive to temperature changes, which can affect performance and reliability. This article provides a detailed technical comparison of FBT and PLC splitters to help network designers, procurement managers, and field engineers make informed decisions aligned with their specific project requirements. PLC splitters utilize integrated optical circuits to split signals via on-chip waveguides. While both splitter types have advantages, their characteristics make certain applications more suitable. FBT splitters, based on fused fiber tapering, offer simplicity and affordability, while PLC splitters, fabricated. Wavelength Sensitivity: Traditional FBT splitters are optimized for specific wavelengths (commonly 1310nm, 1490nm, and 1550nm). Temperature Sensitivity: Their performance can be more susceptible to fluctuations in temperature. A PLC splitter (Planar Lightwave Circuit Splitter) is an essential passive component in fiber optic networks.
