

Core of the 800g Optical Module

Article Overview

The core of an 800G optical module consists of high-speed optical transceivers, laser diodes, photodiodes, advanced modulation technology (PAM4), and integrated photonics and electronics for ultra-fast signal conversion.

Key Components and Technologies

Optical Transceivers: The module's core includes transceivers that convert electrical signals from servers or switches into optical signals for fiber transmission, and vice versa, ensuring high-speed data flow with minimal bit errors . **Laser Diodes and Photodiodes:** These components handle precise signal generation and detection. Laser diodes emit light pulses representing data, while photodiodes detect incoming optical signals and convert them back to electrical form . **Advanced Modulation (PAM4) and FEC:** 800G modules use Pulse Amplitude Modulation 4-level (PAM4) to encode two bits per symbol, effectively doubling the data rate per channel. Forward Error Correction (FEC) ensures extremely low bit error rates, typically fewer than 1 error per 10^{12} bits . **Silicon Photonics and EML Integration:** Many 800G modules leverage silicon photonics or Electro-absorption Modulated Laser (EML) technology to integrate multiple optical components on a single chip, reducing power consumption (
