

Darlington Relay Protection

Overview

For larger relays, a Darlington transistor pair or MOSFET is recommended. Monolithic wideband amplifiers are widely used in the RF and microwave systems. The frequency range of the Darlington amplifiers is. Best suited for relay driving, solenoid driving, and linear regulator applications, our portfolio of Darlington transistors use high-pulse currents in small packages to maximize power efficiency. The ULN2003A is a high-voltage, high-current Darlington transistor array consisting of seven NPN Darlington pairs that feature high-voltage outputs with common-cathode. Relay coils look simple, yet they can be the noisiest part of a control board. A microcontroller pin can toggle logic all day, but it was never meant to energize an inductive coil directly or absorb the switch-off spike. ULN2003A solves that gap in a tidy package.
