

Distribution box and household network cable

Article Overview

A home distribution box serves as the central hub for your wired network, connecting all Ethernet outlets and integrating with fibre or broadband services.

Home Distribution Box

A home distribution box is the central point where all network cables in your house converge. It typically contains a patch panel, an Ethernet switch, and may also house your Optical Network Terminal (ONT) for fibre connections . The box allows you to manage and distribute network signals efficiently to multiple rooms, ensuring a stable and high-speed connection throughout your home. It is recommended to place the distribution box in a central, accessible location, such as a utility room, basement, or office closet .

Cabling Layout

For optimal performance, a star configuration is recommended, where each room has its own dedicated Cat6 cable running back to the distribution box . Key points include:

- Cable type: Cat6 is preferred for modern homes, supporting up to 10 Gbps over short distances .
- Number of cables: Run at least two Cat6 cables per room for flexibility, with additional cables to main entertainment hubs .
- Slack: Leave at least 300mm of slack at each outlet to allow for future adjustments .
- Termination: Use RJ45 modular sockets mounted in a patch panel for neat and reliable connections .

Conduit and External Connections

To connect your home network to external fibre or broadband services:

- Install a 20mm PVC conduit from the external entry point to the home distribution box .
- The External Termination Point (ETP) is mounted outside the home, where the fibre or composite cable enters
