

Emergency Plan for Aerial Optical Cables

Overview

Emergency repair requires a fusion splicer, OTDR, splice enclosure, splice trays, heat-shrink protectors, cable stock of the same fiber type and count, and personal protective equipment appropriate for the site. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Fiber in a duct solutions have a major aesthetic. Buried cables can be cut by earth-moving equipment and aerial cables can have trees fall on them. Once an accident happens, there are two major problems: restoring service to the cable and doing it quickly to minimize the impact on customers. The Fiber Optic Association, Inc. A structured response process including fault location with OTDR, temporary restoration with emergency splice kits, and permanent repair with new cable segments minimizes downtime. Fiber optic network expansions and the demand for Fiber To The Home (FTTH) has put a high demand on fiber optic contractors and contract splicing teams meaning providers can no longer rely on these sources for quick response times.
