

Fiber Optic Switch Serial Port Settings

Article Overview

To configure a fiber optic switch via the serial port, connect the console port to a PC using the appropriate cable and terminal emulation software, then set communication parameters such as baud rate, data bits, parity, and stop bits.

Connecting the Serial Console

- Identify the console port on your fiber optic switch. For Cisco MDS 9148T, this is an RS-232 console port located on the front panel .
- Use the correct cable: Typically, a rollover RJ-45-to-RJ-45 cable is supplied. If your PC has a DB-25 serial port, use an RJ-45-to-DB-25 adapter .
- Connect to a PC: Attach the adapter to your PC's serial port and connect the other end to the switch console port. Ensure the PC supports VT100 terminal emulation.

Terminal Emulation Setup

- Use terminal software such as PuTTY, HyperTerminal, or Tera Term.
- Configure the serial connection with standard parameters:
- Baud rate: 9600 bps (common default)
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None
- Launch the terminal session to access the switch CLI for configuration .
