

# Fiber optic cable tensile force

## Article Overview

Fiber optic cables typically withstand tensile forces ranging from 600 N to 4,500 N depending on design, reinforcement, and installation conditions.

### Understanding Tensile Force

The tensile force of a fiber optic cable refers to the maximum pulling force it can endure before the internal glass fibers begin to stretch, bend, or fail. Since glass is brittle, the cable's structural elements—such as aramid yarns, Kevlar reinforcement, or central strength members—bear most of the mechanical load during installation and operation . Exceeding the rated tensile force can cause microfractures, increased light attenuation, or complete fiber breakage .

### Typical Tensile Strength Values

- Standard outside plant (OSP) cables: Maximum pull around 600 lbf (~2.7 kN) for typical installations .
- Tight-buffer cables with dielectric strength elements: Up to 1.85 kN for a 5.6 mm cable .
- Kevlar-reinforced cables: Can reach 3 kN with 2% maximum strain .
- Installation through conduits: Most cables allow 1,800–4,500 N (400–1,000 lbf) of pulling tension .
- Optical fiber itself: Tensile strength of 500,000–700,000 psi, stronger than steel, but highly sensitive to microcracks .

### Installation and Operating Considerations...
