

Fireproof cable tray thickness specifications

Article Overview

Fireproof cable tray thickness depends on mechanical load, cable weight, and fireproof coating standards, typically ranging from 1.5 mm to 3 mm for metal trays, with additional fireproof coating thickness as specified by national safety codes.

Mechanical Thickness Requirements

The base metal thickness of a cable tray must be sufficient to support the weight and number of cables without deformation or failure. For standard steel or aluminum trays, thicknesses generally range from 1.5 mm to 3 mm, depending on tray width, span between supports, and load type (light, medium, or heavy duty) to ensure structural integrity under full load conditions . Proper installation requires trays to be level, plumb, and securely mounted, with minimal horizontal (≤ 2 mm/m) and vertical (≤ 3 mm/m) deviation .

Fireproof Coating Thickness

Fireproof cable trays are often coated with fire-resistant materials to achieve a required fire rating. The coating thickness must comply with national safety standards and project specifications. Application methods include spraying, rolling, or brushing, and the coating should be uniform, smooth, and free of cracks, bubbles, or peeling . Thickness is typically measured with calibrated devices, and adhesion tests (cross-cut or pull-off) are performed to ensure the coating bonds securely to the tray
