

Formula for calculating OMA at the optical module receiver

Overview

This formula arises from substituting $P_1 = ER \cdot P_0$ and solving the system of equations. A few observations: If the extinction ratio is very high (i., $ER \gg 1$, then $ER - 1/ER + 1 \approx 1$, and $OMA \approx 2P_{avg}$. In practice, the extinction ratio is limited by laser/device physics, so you seldom. Among them, Optical Modulation Amplitude (OMA) is a central figure of merit for digital (on-off) modulation schemes. It indicates the difference between the optical power levels of signal "1" and signal "0" received by an optical module. 23 dB $\rightarrow$ decrease powers by 2. The Eye mode PAM Outer OMA measurement measures Optical Modulation Amplitude (OMA) with PAM4 (levels 0 and 3), PAM6 (levels 0 and 5), and PAM8 (levels 0 and 7). This measurement can also be made on NRZ waveforms.

OMA/Sensitivity Converter | Sanoc SFP Module Manufacturer

OMA is the difference between the optical power levels of a digital signal generated by an optical source, such as a laser diode. Where P_1 is the optical power when the light source is "on" and P_0 is the ...

Jan 07, 2026

Optical Modulation Amplitude (OMA)

OMA is related to the bit error rate (BER) of the receiver. Theoretically, the BER of a system is determined by the optical signal-to-noise ratio (OSNR) or Q factor. $P_1 - P_0 = OMA$. The denominator ...
