

High-speed electromechanical optical cable

Article Overview

High-speed electromechanical optical cables combine electrical power, optical data transmission, and mechanical strength in a single hybrid cable for demanding industrial, subsea, and data center applications.

Overview

High-speed electromechanical optical cables are hybrid cables that integrate electrical conductors, optical fibers, and load-bearing members into a single construction. This design allows the cable to carry power, control signals, and high-speed data while also supporting mechanical loads such as towing, lifting, or deployment in harsh environments . These cables are engineered for repeated bending, tension, and handling, ensuring reliable performance in subsea, offshore, industrial, and oil-and-gas applications .

Optical and High-Speed Data Capabilities

Active Optical Cables (AOCs) are a key example of high-speed optical solutions. They integrate fiber-optic transceivers directly into the cable, converting electrical signals into optical signals for transmission. This allows data rates from 12G to 400G, with low latency, long reach, and improved signal integrity compared to traditional copper cables . For instance, QSFP28 100G AOCs use 850nm VCSEL lasers and PIN receivers to achieve high-speed interconnects with ultra-low power consumption and EMI immunity, making them ideal for data centers and high-performance computing (HP...
