

Installation of fiber optic broadband

Article Overview

Fiber optic broadband installation involves connecting your property to a high-speed fiber network using specialized equipment like an Optical Network Terminal (ONT), typically completed in 2-6 hours.

Checking Availability

Before installation, confirm that fiber service is available in your area. Providers often require existing fiber infrastructure nearby, such as underground ducts or utility poles carrying fiber lines. You can check availability by contacting your internet service provider or looking for local fiber infrastructure signs .

Types of Fiber Connections

- FTTH (Fiber to the Home): Direct fiber connection to your home, offering the fastest speeds .
- FTTP (Fiber to the Premises): Similar to FTTH, often used for businesses or multi-unit buildings .
- FTTC (Fiber to the Cabinet): Fiber reaches a nearby cabinet, with the last segment using copper wiring .

Installation Process

- Site Survey: Engineers may assess your property to determine the best route for the fiber cable, considering obstacles like roads, brooks, or existing utility lines .
- Running the Cable: Fiber is brought from the nearest network point to your property, either overhead via poles or underground through ducts
