

Is slow internet speed related to the optical splitter

Overview

In most cases, a splitter does not significantly affect internet speed if installed correctly. This leads to a congestion of bandwidth, resulting in slower speeds for each device. Signal loss refers to the attenuation of the digital signal traveling over a cable. Cable splitters, also known as network taps or cable signal repeaters, are designed to split a single internet connection into multiple channels or frequencies, resulting in slower internet speeds. This issue has been a topic of much debate and discussion in recent years, with the rise of streaming. This process involves inserting a passive splitter into the line, which physically divides the signal path. But if you care about fast file transfers, gaming, or streaming, it can definitely hold you back. In fact, using an Ethernet splitter could actually restrict you to 100 Mbps, even if your network handles much faster connections.
