

Lead-acid battery cabinet is resistant to high temperatures

Overview

A quality battery charging cabinet should have built-in ventilation to: Maintain a stable internal temperature. Expel heat and prevent overheating. Reduce accumulation of toxic or flammable gases. More current increases heat, which further raises temperature, repeating in a loop until the battery overheats and can fail catastrophically. The Joule heat generated on the internal resistance of the cell due to current flow, the exothermic charging reaction, and above all, the gradual increase in polarization as. Lead-acid battery is a type of secondary battery which uses a positive electrode of brown lead oxide (sometimes called lead peroxide), a negative electrode of metallic lead and an electrolyte of sulfuric acid (in either liquid or gel form).
