

Material Requirements for Indoor Distribution Boxes

Article Overview

Indoor distribution boxes are typically made from cold-rolled steel or stainless steel with sufficient thickness, designed for electrical safety, mechanical durability, and proper installation standards.

Material Requirements

Enclosure Materials: Indoor distribution boxes are generally constructed from cold-rolled steel or 304 stainless steel, providing strength, corrosion resistance, and durability for indoor environments such as residences, offices, and factories. For lighter-duty applications, insulating plastics like polycarbonate or fiberglass-reinforced plastic may be used to provide electrical insulation and impact resistance . Wooden materials are not recommended due to fire and durability concerns .

Mechanical Strength: Steel plates for enclosures should have a minimum thickness of 1.5mm, with cabinet bodies of power distribution cabinets at 2.0mm, doors and panels at 2.0mm, and back panels at 3.0mm. Guide rails and mounting lugs must be sturdy, with mounting lugs made of 40×4 flat steel, 10cm long, welded at the bottom left and top right for non-floor-standing boxes .

Fire and Heat Resistance: Materials must resist burning and contain potential fire hazards. Plastic enclosures provide insulation, while metal boxes require additional insulation linings to prevent electric shock .

Electrical Insulation: For safety, insulating properties are critical. Plastic boxes inherently provide insulation, while metal boxes require internal insulation linings to prevent accidental contact with live components
