

Optical Module ILRL

Overview

By using optical frequency domain reflectometry (OFDR), it measures both insertion loss (IL) and return loss (RL) in the spectral domain as well as in the time or length domains. The IL RL OPM2 module serves as an interface between the tunable laser and the. However, before addressing common causes of poor IL/RL, let's quickly explain the terms: Insertion Loss (IL) - The loss of signal power resulting from inserting a device in an optical fiber. This can be referred to as attenuation and is usually expressed as a ratio, in dB, relative to the input. We have been manufacturing fiber optic cable assembly test equipment since 2002. Our premium test equipment is the fastest and most accurate in its class. The Luna 6415 Lightwave Component Analyzer helps shorten the design cycle of photonic integrated circuits (PICs), silicon photonics, and fiber optics technology and increases manufacturing throughput.
