

Outdoor cabinet temperature

Overview

Target Temperature: Keep internal temperatures below 95°F (35°C) to ensure safe and efficient operation. Passive: Vents, shade, and natural airflow – best for mild conditions. Between solar radiation pounding down on cabinet surfaces, internal electronics adding their own thermal loads, and ambient temperature jumping from colder-than-anything winter to hotter-than-ever summer, the phenomena that threaten overheating are tangible—and costly. One thermal transient event. Outdoor enclosures are being designed to house various equipment configurations with dissipating heat rates ranging from 100 up to 100,000 W and higher, depending on the size and type of equipment. Without proper cooling, the equipment. Air throughput 20 – 1,160 m³/h, protection category IP 54 as standard. The energy-efficient version with EC technology stands out for more than just its unique IoT capabilities. An outdoor electronics cabinet failing at a remote site is more than an inconvenience; it's a cascade of operational and financial liabilities.
