

Requirements for Ring Network Industrial Switches

Overview

These include protocol coexistence requirements for Modbus TCP, Profinet, and EtherCAT; environmental factors like electromagnetic noise and mechanical vibrations causing packet loss; and stringent real-time requirements where PLC communication delays must be kept under 1ms. Device Level Ring (DLR) is a Layer 2 protocol that enables redundancy in a ring topology, providing fast network fault detection and reconfiguration for industrial networks. DLR is an EtherNet/IP™ protocol that is defined by the Open DeviceNet® Vendors' Association (ODVA). DLR network includes at. In the realm of Industrial Internet of Things (IIoT), the significance of robust and reliable networking infrastructure cannot be overstated. Industrial switches, as the core components of this infrastructure, play a pivotal role in establishing and maintaining the integrity of industrial ring. This document provides basic background information regarding adding ring redundancy in your wired Ethernet networks. MRP Media Redundancy Manager (MRM) defines its maximum recovery times for a ring in the following. The fiber optic ring redundancy design for industrial Ethernet switches is precisely engineered to address this pain point—achieving millisecond-level fault self-healing through the synergy of physical ring architecture and intelligent protocols, thereby constructing the "self-healing heart" of. Media Redundancy Protocol (MRP), defined in IEC 62439-2, is a standardized industrial Ethernet ring redundancy protocol designed for high-speed network recovery.
