

Simple Fiber Optic Cable Laying Tool

Article Overview

Essential simple tools for fiber optic cable laying include cable strippers, cleavers, fusion splicers, Kevlar cutters, and basic testing equipment.

Key Tools

1. Fiber Optic Cable Strippers These are specialized tools used to remove the protective outer jacket and buffer layers of fiber optic cables without damaging the delicate glass core. They allow precise stripping of 250µm, 900µm, or larger cable jackets, preparing the fiber for splicing or termination . 2. Fiber Optic Cleaver A cleaver cuts the fiber at a precise 90-degree angle, ensuring a smooth end face for splicing. Proper cleaving minimizes signal loss and is critical for high-quality connections . 3. Fusion Splicer This device aligns two fiber ends and fuses them using an electric arc. Fusion splicers provide low-loss, durable connections and are essential for joining long cable runs or repairing breaks . 4. Kevlar Cutter Fiber optic cables often contain Kevlar yarn for strength. Kevlar cutters are designed to cleanly cut these fibers without dulling, which regular scissors cannot handle . 5. Cleaning Tools Lint-free wipes, cleaning fluid, and cleaning sticks are used to clean fiber end faces and connectors. Clean connectors are crucial to prevent signal loss . 6. Basic Testing Equipment

- Optical Power Meter: Measures the optical signal strength in the fiber.
- Light Source: Sends a known signal through the fiber to check for losses. These tools help verify the integrity of the installation and ensure optimal performance .
- 7. Optional Hand Tools Common hand tools like screwdrivers, pliers, and wrenches may also be needed for cable routing, securing hardware, or handling conduit
