

Thickened material for network cabinets

Article Overview

Cold-rolled steel and stainless steel with thicknesses from 1.0mm to 1.5mm are commonly used for durable, high-load network cabinets.

Common Materials and Thicknesses

Cold-Rolled Steel (SPCC/SPHC): Widely used for network and server cabinets due to its high strength, rigidity, and cost-effectiveness. Typical thickness ranges from 0.8mm to 2.0mm, with 1.0–1.5mm being standard for main frames and side panels. It supports heavy equipment like servers and UPS units, providing excellent anti-deformation properties for 42U racks and large data center cabinets . **Stainless Steel (304):** Often used for dust-proof frames, doors, or panels where corrosion resistance is critical. Thicknesses are usually around 0.8–1.0mm, offering durability in humid or outdoor environments while maintaining rust-proof performance . **Aluminum Alloy:** Lightweight alternative with good corrosion resistance, but lower load-bearing capacity. Suitable for lightweight or portable network cabinets, typically in environments where heavy equipment is not installed . **Composite Materials and Fiberglass:** Used in specialized scenarios requiring insulation, corrosion resistance, or lightweight construction. These materials are less common for heavy-duty server racks due to lower structural strength .

Practical Considerations

- **Main Frame:** 1.5mm cold-rolled steel with galvanization is ideal for high-load cabinets, ensuring stability and long-term durability .
- **Front/Rear Doors & Side Panels:** 1.2mm cold-rolled steel balances rigidity and wei...
