

What is a normal optical power level for an ONU optical module to receive

Overview

A normal receive (RX) optical power range for most ONUs is typically between -8 dBm and -27 dBm . If the RX power falls outside this range, it often indicates a physical layer issue such as a dirty connector, excessive fiber loss, or a failing optical module. Here are the receive and transmit specs by PON class, the field method to measure them, and what the numbers mean for long-term reliability. Spec window is -8 to -28 dBm (Class B+); the edges are pass/fail, not where you want to live. Too low. Q1: What is the standard OLT CLI command to check ONU optical power on Huawei equipment?

The primary command to query both the receiving and transmitting optical power of an ONU on a Huawei OLT is display ont optical-info. Engineers use the decibel-milliwatt (dBm) to quantify the absolute. Because optical power levels range widely, the decibel-milliwatt (dBm) is used instead of a linear unit like the milliwatt (mW). The dBm scale is logarithmic, meaning a small numerical change represents a large change in actual light power. However, in actual use, the ONU may encounter problems such as low.
