

What is the flat fiber optic splice closure called

Overview

Horizontal closures, also known as inline type fiber splice closures, have a flat or cylindrical shape. These closures are the most common fiber optic closure types used in aerial and underground installations. This guide is written to provide a complete and engineering-oriented understanding of fiber optic splice closures—from basic concepts and. For protection against the outside plant environment and damage, splices require placement in a protective enclosure, usually called a splice closure. Splices are generally placed in a splice tray which is then placed inside a splice closure or integrated into a fiber pedestal for OSP. The fiber splice closures deliver proven reliability, flexibility and environmental protection for FTTH networks, supporting applications ranging from trunk to drop. 9 billion in 2025, reflecting the rising demand for network reliability. It is usually used with outdoor fiber optic. FOSC represents a fundamental element in contemporary telecommunications infrastructure, serving as the protective housing that shields fiber optic splices from environmental hazards, mechanical stress, and other potential damage sources.
