

What is the outer sheath of an optical cable called

Overview

A fiber optic cable jacket is the outermost protective layer of an optical fiber cable. Structurally, a fiber cable comprises the core, cladding, coating, strength member, and outer jacket. The fiber jacket protects against moisture, UV exposure, chemicals, and mechanical. The fiber optic cable core is the physical glass medium that transports optical signals from an attached light source to a receiving device. The light is transported along the optical fiber via its smallest and most crucial component, which is called the core. It consists of double-sided plastic-coated aluminum strips (PAP) or steel strips (PSP) longitudinally. This article explains the differences between LSZH, HDPE, and LDPE cable sheaths, and how to select the right option based on real deployment conditions.
