

Which port on the fiber optic cable should the router be connected to

Article Overview

Fiber optic cables typically connect to a router through an Optical Network Terminal (ONT) using the router's WAN port or an SFP/fiber port.

Connection Overview

Fiber optic internet usually requires an Optical Network Terminal (ONT), which converts the light signals from the fiber cable into electrical signals compatible with standard networking equipment. The fiber optic cable from your ISP plugs into the ONT's designated fiber port, often using SC/APC or SC/UPC connectors .

Router Port for Fiber Connection

Once the ONT receives the fiber signal, it connects to your router using one of the following ports:

- **WAN Port (Ethernet):** Most home routers use a standard Ethernet WAN port to receive the internet signal from the ONT. You connect the ONT's Ethernet/LAN port to the router's WAN port using a Cat6 or higher Ethernet cable .
- **SFP Port (Small Form-factor Pluggable):** Some fiber-ready routers have a dedicated SFP or SFP+ slot that allows direct insertion of a fiber optic module. This is common in high-speed or enterprise setups and supports direct fiber input without an ONT .
