

Why do fiber optic cables need to have wire ends left

Overview

Proper fiber optic termination is a crucial process for ensuring the reliability, performance, and long-term durability of any fiber optic network. The process of fiber optic cable termination is the essential act of connecting fiber optic cables to devices, patch panels, or other. Fiber optic joints or terminations - where cables are terminated - are made two ways: 1) connectors that mate two fibers to create a temporary joint and/or connect the fiber to a piece of network gear (left) or 2) splices which create a permanent joint between the two fibers (right). This involves either installing a connector or creating a splice to establish a reliable connection point for the optical signal. In order to terminate a. Method A uses straight-through MPO array cables to map the fibers the same way on each end of the link. They are connected by Type A adapters or cassettes, which have a “key-up/key-down” orientation.
